YaraVita[®] PRISTINE GREEN[™]

A formulated product for the treatment of iron deficiency by foliar application

Guaranteed Analysis:	
Iron (Fe)	3.9%
3.9% chelated Iron Derived from iron EDDHA	

The information provided is accurate to the best of Yara's knowledge and belief. Any recommendations are meant as a guide and must be adapted to suit local conditions.

YaraVita Pristine Green is a soluble source of Iron (Fe), chelated in the form of EDDHA for enhancing and sustaining uptake efficiently over a wide range of pH variances.

Iron (Fe) is the most required micronutrient for turfgrass and has many important physiological functions. Fe uptake can be affected by many soil factors that are detrimental to Fe uptake. It is important to apply Fe in a highly soluble form to avoid precipitation and becoming unavailable. Fe is critical for chlorophyll formation and many photosynthetic activities, which is critical for ensuring healthy turf.

Application

Turfgrass:

0.25 to 1.0 fl oz per 1000 sq ft in a water volume of at least 1.5 Gallons/1000 sq ft every 7-14 days during the growing season based on nutritional requirements.

Nursery stock/ornamentals:

Apply 2 fl. oz per 1,000 sq. ft. or 2-4 fl. oz. per 1,000 row feet every 5-6 weeks based on nutritional requirements.

Benefits

- Formulated for safe application at critical growth stages to satisfy turf requirements
- Widely tank mixable with other turf sprays. Visit www.tankmix.com/yara for details.
- Tested on a wide range of crops worldwide for safety.
- High quality, consistent product. Manufactured to ISO 9001 quality assurance standards
- Easy to use liquid formulation. Pours and disperses easily and quickly into the spray tank.
- High nutrient content for easily correcting deficiency issues.
