Micronutrient Fertilizer Coatings

## BALANCED NUTRITION. BORING AT THE BBQ. THRILLING IN THE FIELDS.

If your neighbor's crop looks greener, they might be doing one thing differently: **micronutrients**.

Balanced crop nutrition is more than just macronutrients. Micronutrients like boron, copper, manganese, and zinc are essential, even in small amounts, to unlock your crop's full potential.

### Why Micronutrients Matter

**Boron:** Boosts root and shoot growth, improves pollination, and works with calcium to strengthen cell walls for better disease resistance.

**Copper:** Critical for flowering, straw strength, and grain quality, especially in cereals.

**Manganese:** Powers chlorophyll production and enzyme activation, improving photosynthesis and dry matter content.

**Zinc:** Drives root development, hormone regulation, and grain fill, essential for seed quality and protein synthesis.

With **YaraVita PROCOTE**, you can deliver these nutrients efficiently through your dry fertilizer - no extra steps, no added complexity.

- ✓ Higher yields
- ✓ Better nutrient uptake
- ✓ Improved water use efficiency
- ✓ Cleaner, dust-free handling

Don't let the smallest nutrients limit your biggest results. Discuss PROCOTE Micronutrients with your retailer today.
